Naive Bayes Classification

Naive Bayes method is a supervised learning algorithm based on Bayes' theorem

It is taking the "naive" assumption of independence between every pair of features.

Baye's Rule

$$P(b \mid a) = \frac{P(a \mid b)P(b)}{P(a)}$$

Naïve Bayes Classifier

$$P(y|X) = \frac{P(X|y)P(y)}{P(X)}$$

where, y is class variable and X is a dependent feature vector (of size n) where:

$$X = (x_1, x_2, x_3,, x_n)$$

Now, if any two events A and B are independent, then,

$$P(A,B) = P(A)P(B)$$

Hence, we reach to the result:

$$P(y|x_1,...,x_n) = \frac{P(x_1|y)P(x_2|y)...P(x_n|y)P(y)}{P(x_1)P(x_2)...P(x_n)}$$

which can be expressed as:

$$P(y|x_1,...,x_n) = \frac{P(y) \prod_{i=1}^n P(x_i|y)}{P(x_1)P(x_2)...P(x_n)}$$

Now, as the denominator remains constant for a given input, we can remove that term:

$$P(y|x_1,...,x_n) \propto P(y) \prod_{i=1}^n P(x_i|y)$$

we need to classify whether players will play or not based on weather condition

| Weather | Play |
|----------|------|
| Sunny | No |
| Overcast | Yes |
| Rainy | Yes |
| Sunny | Yes |
| Sunny | Yes |
| Overcast | Yes |
| Rainy | No |
| Rainy | No |
| Sunny | Yes |
| Rainy | Yes |
| Sunny | No |
| Overcast | Yes |
| Overcast | Yes |
| Rainy | No |

Problem: Players will play if weather is sunny. Is this statement is correct?

| Weather | Play |
|----------|------|
| Sunny | No |
| Overcast | Yes |
| Rainy | Yes |
| Sunny | Yes |
| Sunny | Yes |
| Overcast | Yes |
| Rainy | No |
| Rainy | No |
| Sunny | Yes |
| Rainy | Yes |
| Sunny | No |
| Overcast | Yes |
| Overcast | Yes |
| Rainy | No |

| Frequency Table | | | | | |
|-----------------|----|-----|--|--|--|
| Weather | No | Yes | | | |
| Overcast | | 4 | | | |
| Rainy | 3 | 2 | | | |
| Sunny | 2 | 3 | | | |
| Grand Total | 5 | 9 | | | |

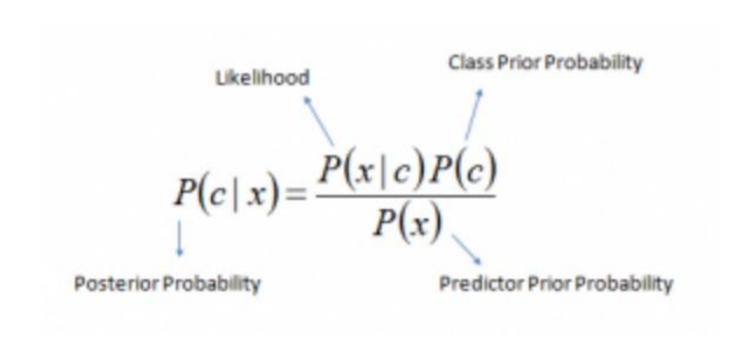

| Like | lihood tab | le | | |
|----------|------------|-------|-------|------|
| Weather | No | Yes | | |
| Overcast | | 4 | =4/14 | 0.29 |
| Rainy | 3 | 2 | =5/14 | 0.36 |
| Sunny | 2 | 3 | =5/14 | 0.36 |
| All | 5 | 9 | | |
| | =5/14 | =9/14 | | |
| | 0.36 | 0.64 | | |

P(Yes | Sunny) = P(Sunny | Yes) * P(Yes) / P (Sunny)

Here we have P (Sunny | Yes) = 3/9 = 0.33, P(Sunny) = 5/14 = 0.36, P(Yes)= 9/14 = 0.64

Now, P (Yes | Sunny) = 0.33 * 0.64 / 0.36 = 0.60, which has higher probability.

Baye's Rule

Naive Bayes Classifier

- When to use:
 - Moderate or large training set available
 - Attributes that describe instances are conditionally independent given classification
- Successful applications:
 - Diagnosis
 - Classifying text documents
